Abstract of **JP9313366**

PROBLEM TO BE SOLVED: To prevent the surface of a tableware handling tool from being damaged or worn by providing the main body of a pad having a protecting face part for covering the surface of the tableware handling instrument and a permanent magnet material for fixing the protective face part while being sucked on the handling tool.
SOLUTION: This protective pad 20 for protecting a working face 13 of a working table 10 is provided with a protective face part 21 for applying a surface part for covering the working face 13, the main body of the pad formed of a stainless thin steel plate having a frame part 22 at the peripheral edge of this protecting face part 21, and permanent magnet material 23 fitted to the frame part 22 and sucked onto the working face part 13 so as to fix the protecting face part 21 to the main body of the pad onto the working face 13. When the pad 20 having such structure is placed on the working face 13 of the working table 10, since the stainless steel material of the working face 13 is magnetic, the permanent magnet material 23 fitted to the frame part 22 is sucked onto that working face 13 by magnetic force so as to be fixed there. Then, the protecting face part 21 at the main body of the pad 20 for protection covers and protects the working face 13.
